prion protein. The specification describes a method for the diagnosis of subacute transmissible spongiform encephalopathy (ESST) caused by a strain of unconventional transmissible agent. The method comprises detecting abnormal prion protein in a biological sample. The sample is treated with at least one protein as knile retaining at least some of the octapeptide repeats in the prion protein, then treatment with a ligand for octapeptide repeats and detecting any formation of a complex. The method is used to diagnose ESST, particularly (new variant) creuzzfeld-Jakob diseases, bovine spongiform encephalopathy and

The sequences given in AAR38025-36 represent polypeptides derived from an antigenic site, region E, of a prion protein. Prion proteins comprise six regions of interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (FPPC) and the scrapic-associated form (FPPC). These peptides may include rare or synthetic anino acids or a ratio-inverso peptide modification to improve resistance to enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antigen; prion; protein; region; frame shift; repeat; mutation; PrPc; FSa; Subfragment; antibody; treatment; spondiform encephalopathy, human; sheep; cattle; cellular binding; aggregation; mammal; scrapie; immune system; PrPsc; ratio-inverso peptide; enzymatic degradation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   an antigenic site, region E, of a prion protein. Prion proteins comprise six regions of interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PrPc) and the scrapie-associated form (PrPsc). These peptides may include rare or synthetic amino acids or a ratio-inverse peptide modification to improve resistance to enzymatic

                          an antigenic site, region E, of a prion protein. Prion proteins comprise six regions of interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PPPC) and the scrapic-associated form (PPPSC). These peptides may include rare or synthetic amino acids or a ratioinverso peptide modification to improve resistance to enzymatic
The sequences given in AAR38025-36 represent polypeptides derived from

                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAR38025-36 represent polypeptides derived from an antigenic site, region E, of a prion protein. Prion proteins comprise six regions of interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PFPC) and the scrapic-associated form (PFPC). These peptides may include rare or synthetic amino acids or a rationary and acids or a rational proverso peptide modification to improve resistance to enzymatic

```
antiserum against a human or animal prion protein (PrP) which can be used in immunoassays for detecting PrP's. The method comprises (a) selecting a polypeptide that has a length of at least 10 amino acids and has an amino acid sequence at least 70% homologous to that of human, bovine or murine PrP in a region of at least 10 consecutive amino acids and (c) binding a metal to the polypeptide by reaction with a metal compound and (c) injecting the metal-containing polypeptide into a host animal, optionally together with adjuvants, to induce production of a polyclonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel process for producing a polyclonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Spinal cord; cattle; sheep; pig; bovine spongiform encephalopathy; BSE; scrapie; transmissable spongiform encephalopathy; TSE; immunological assay; scrapie prion protein; prpSC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28..61 /note= "Synthetic sequence used to raise antibody against prpSC"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps, 0;
                                                                                                                                                                                                                                                                                                   The invention claims to provide a method for detecting transmissable spongiform encephalopathies (TSE) in animals and in animal carcasses. The method comprises of an immunological assay whereby the animal test sample is reacted with a labelled antibody against scrapic prion protein (prpSC) and the amount of bound labelled antibody is then detected. The anti-prpSC antibodies used in the assay are raised against fragments of the present synthetic peptide shown. The peptide fragments preferred by the inventors are shown in the features table. The method is claimed to be useful when applied to samples, particularly a cross-section of the spinal cord, from cattle, sheep and pig carcasses for detection of bovine spongiform encephalopathy (BSE) or scrapie.
                                                                                                                                                                                                                Detecting pathogenic prion(s) in animal carcasses - by reaction with specific labelled antibody, used to detect those carrying agents for bovine spongiform encephalopathy and scrapie
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          37.68 // Anote= "Repeat region consisting of tandem repeats of repeat unit: PHGGGWGQ (AAB07319)"

The present sequence is the mouse prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible Spongiform Encephalopathies (TEEs). Examples of TEEs include Bovine Spongiform Encephalopathy (BSE), Scrapie, Creutzfeldt-Jakob disease (CLD) and Gerstamn-Straussler-Speinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates TSE. PrP epitopes (AMB07320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                29..69

                                                                                                                                                                                                                                                             ö
                                                                                         The present sequence is the human prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible Spongiform Encephalopathies (TSES). Examples of TSES include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Selminker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is them detected. The presence of PrP indicates TSE. PrP epitopes (ABB07320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.
                                                                                                                                                                                                                                                              Gaps

The present sequence is the mouse prion protein (PrP) sequence. Conversion of the normal callular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible Spondiform Encephalopathies (TFES). Examples of TSES include Bovine Spondiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Shelnker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates TSE. PrP epitopes (ABB07320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tandem repeats
New immunoassay for prion protein, used for determination of transmissible spongiform encephalopathies in mammals, comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New immunoassay for prion protein, used for determination of transmissible spongiform encephalopathies in mammals, comprises specific capture antibody -

                                                                                                                                                                                                                                                                                                                                                                                          ó
                                                                                           Spongiform Encephalopathies (TSES). Examples of TSES include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates TSE. PrP epitopes (AAB07320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an adjurgated state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hamster; Prp; cerebroprotective; PrP conversion inhibitor; prion protein, transmissable spongiform encephalopathy; TSE; neurodegenerative disease; protease-sensitive prion protein; PrPsen, protease-resistant prion protein; PrPsen,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transmissible spongiform encephalopathies (TSE) are fatal neurodegenerative diseases. These diseases are characterised by the formation and accumulation, in the brain, of an abnormal proteinase K resistant isoform (PrPres) of a normal proteaser-sensitive host-encoded prion protein (PrPsen). The present invention relates to peptides comprising a hamster, human or murine prion protein (PrP) fragment which specifically inhibit the conversion of protease-sensitive prion protein (PrPsen) to protease-resistant prion protein (PrPres). The present sequence is one such peptide. The peptides of the present invention are
                                  The present sequence is the human prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible
                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide comprises hamster prion protein fragment that inhibits conversion of prion protein from protease-sensitive to protease-resistant form, useful for diagnosis and treatment of spongiform encephalopathies

```
The present sequence represents a prion protein. The specification describes chimeric polypeptides, which comprise at least one SCHAGG (self-coalesces into higher-order aggregates) amino acid sequence fused in frame with a polypeptide of interest (which is other than a marker protein, a glutathione-S-transferase or a staphylococcal nuclear protein). The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable phenotypic alteration in a cell, e.g. for gene therapy, protein production, imparting disease resistance to plants, altering plant pigmentation and for diagnosis and treatment of prion diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a prion protein. The specification describes chimeric polypeptides, which comprisest, least one. SCHAG. (self-coalesces into higher-order aggregates) each oach gequence fused in frame with a polypeptide of interest (which is other than a marker protein, a glutathione-S-transferase or a staphylococcal nuclear to protein). The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable phenotypic alteration in cell, e.g. for gene therapy, protein production, imparting disease resistance to plants, altering plant pigmentation and for diagnosis and treatment of prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid encoding chimeric proteins with self-assembly properties, useful e.g. for diagnosis and treatment of prion diseases, also related aggregates, fibrils and polymers -.

The present sequence is the cattle prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible spongiform Encephalopathies (TEEs). Examples of TEEs include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CLD) and Gerstmann-Straussler-Seheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates BSE. PrP epitopes (ABB07320-807326) and detected from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó

| Sequence 20, Application US/09128450
| Sequence 20, Application US/09128450
| Patent No. 6211149
| GENERAL INFORMATION:
| APPLICANT: Chesebro, Bruce W
| APPLICANT: Caughey, Joselle
| APPLICANT: Priola, Susette
| TITLE OF INVENTION: Inhibitors of Formation of Protease Resistant Prion
| TITLE OF INVENTION: Protein
| FILE REFERENCE: 50121
| CURRENT APPLICATION NUMBER: US/09/128,450
| CURRENT FILING DATE: 1998-08-03
| NUMBER OF SEQ ID NOS: 29
| SOFTWARE: PatentIn Ver. 2.0

prion protein - rabbit
C;Species: Oryctolagus cuniculus (domestic rabbit)
C;Date: 11-Apr.1997 #sequence_revision 09-May-1997 #text_change 13-Aug-1999
C;Accession: JG6175
R;Loftus, B:; Rogers, M.
Gene 184, 215-219, 1997
A;Title: Characterization of a prion protein (PrP) gene from rabbit; a species with a A;Reference number: JG6175; MUID:97183665
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A; MOJECULE type: DNA

-1- DISEASE: PRP IS FOUND IN HIGH QUANTITY IN THE BRAIN OF HUMANS AND ANIMALS INFECTED WITH THE DEGENERATIVE NUCROLOGICAL DISEASES KURU, CREUTZFELDT-JAKOB DISEASE (CID), GERSTMANN-STRAUSSLER SYNDROME (GSS), SCRAPIE, BOVINE SPONGIFORM ENCEPHALOPATHY (BSE), TRANSMISSIBLE MINK ENCEPHALOPATHY (TME), ETC.
-1- SIMILARITY: BELONGS TO THE PRION FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    der Kuyl A.C., Dekker J.T., Goudsmit J.;
Submitted (NOV-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THE FUNCTION OF PRP IS NOT KNOWN. PRP IS ENCODED IN THE
HOST GENOME AND IS EXPRESSED BOTH IN NORMAL AND INFECTED CELLS.
-!- SUBUNIT: PRP HAS A TENDENCY TO AGGREGATE YIELDING POLYMERS CALLED
                                                                                                                                                                                                                          Gaps

```
transduction G-protein coupled receptors designated T2R proteins.
Transduction G-protein coupled receptors designated T2R proteins.
Transduction G-protein coupled receptors designated T2R proteins.
The T2R proteins are taste modulators. The nucleic acids are useful as probes for the identification of taste cells, as the nucleic acids are specifically expressed in taste cells. They also serve as tools for the performance cells. They also serve as tools for the performance cells of the tonger and taste sealors between the taste cells of the tongue and taste seasory neurons leading to taste centres in the brain. The taste modulators are useful for pharmacological and genetic modulation of taste signalling pathways.

Modulatory compounds comparising T2R proteins can therefore be used in clood and pharmaceutical industries to customise taste, for e.g. to

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium coryneform bacterium coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Curyneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; immune; haematopoietic; immune/haematopoietic antigen; cancer; cytostatic; gene therapy; vaccine; metastasis.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis

Claim 11; SEQ ID NO 11154; 3071pp + Sequence Listing; English.

AAKASAUL TO ARKAROLO Encode the numan immunes can fitting and sequences given in AMM81270. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that ffect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting protein. (I) proteins and polynucleotides may be used to protein. (C) proteins and polynucleotide. The activity of the matched diseases, especially diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic antigen genomic to AAK87694 répresent human immune/haematopoietic antigen genomic sequences from the present invention. AAK85492 to AAK\$4950 and AAM82169 represent sequences used in the exemplification of the present invention. AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynpeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, ac; stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                           Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; hmwunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschbprung's disease, chronic colitis or ulcerative colitis. The present sequence is a digestive system antigen of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                       Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders of the digestive system, particularly cancer and cancer metastases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                               ö
                                                                                                                                The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded bý a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human brain expressed single exon probe encoded protein SEQ ID NO: 34479
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; brain expressed exon; gene expression analysis; probe; microarray; Alzhelmer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.

(SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                          Peptide #6962 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to human single exon nucleic acid probes
                                                                                                                                                                                                                                                                                                                                                                                                  human; microarray; gene expression; cervical epithelial cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells –
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 31; DB 22; I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present sequence is a conserved sequence from Caenorhabditis elegans and Homo sapiens. A number of C. elegans proteins have been identified that have mammalian homologues acting in the insulin signaling pathway. The C. elegans age-1 gene encodes a homologue of the mammalian PI s-kinase whilst daf-2 encodes a homologue of the mammalian Insulin receptor. The C. elegans AKT kinase and PKB kinase act downstream of daf-2 and age-1, just as their mammalian homologues act downstream of insulin signalling. The C. elegans PTEN lipid phosphatase homologue. DAF-18, has been found to act upstream of AKT in the pathway. This discovery has enabled mammalian PTEN action to be mapped to the insulin signalling pathway. Conserved DAF motifies and thus to identify individuals with a predisposition towards the development of glucose intolerance conditions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                      Peptide #9330 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Caenorhabditis elegans; human; daf-18; insulin signalling pathway; daf-2; age-1; insulin receptor; PI 3-kinase; PKB kinase; PTEN lipid phosphatase; antidiabetic; anorectic; obesity; diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                            18-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   23-JUN-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           29-JUN-1999
                                                                                                                                                                                                                                                                   10-JUN-19
14-JUN-19
  ***********************
                                                                                        The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                   Gaps
                              Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune

```
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune disorders -

peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
